**Real-Time Rendering &  
Graphics Hardware**

Pradeep Sen  
Advanced Graphics Lab

Class 21  
April 11, 2007

### Announcements

- Project handout will be available online

### Last time

- Real-time geometry representations

### Today

- Procedural geometry for real-time applications

### Introduction to procedural geometry

- Traditional ways to represent geometry has several disadvantages:
  - Large storage requirements: every polygon needs to be stored
  - Lack of scalability: not so easy to change resolution in real-time
  - Geometry is difficult to modify in the application
  - Bandwidth bottleneck between CPU and GPU

### Introduction to procedural geometry

- Unlike standard geometry, procedural geometry is generated “on the fly”
- It has several advantages
  - Low storage overhead: typical tradeoff of computation for storage... store a small amount of information and reconstruct the rest
  - Scalable: The models can be generated at any target resolution
  - Reduce bandwidth bottleneck: less information to transmit from the CPU to GPU

### Different kinds of “procedural” graphics

- Vertex and fragment shaders
- Procedural animation (physics based)
- Procedural geometry (plants, clouds, terrain)

### Procedural animations

- Typically involve solving physics equations (mechanics) to determine the motion of objects in the environment

### L-Systems

- Developed by biologist Aristid Lindenmayer to describe growth of simple multicellular organisms
- Formal grammar based on a starting axiom and a set of rules
- 3 kinds of L-systems:
  - Deterministic context-free
  - Stochastic context-free
  - Context-sensitive

### Example

- Axiom: A
- Rule:  $A \rightarrow B-A-B, B \rightarrow A+B+A$

A  
 B-A-B  
 A+B+A-B-A-B-A+B+A

 Real-time Rendering & Graphics Hardware  
 Pradeep Sen Class 21 – April 11, 2007

### L-Systems

- Most successful in procedural generation of plants

 Real-time Rendering & Graphics Hardware  
 Pradeep Sen Class 21 – April 11, 2007

### Example

Pramod Sharma and Guillaume Poncin

 Real-time Rendering & Graphics Hardware  
 Pradeep Sen Class 21 – April 11, 2007

### Procedural terrain

Image courtesy Jacob Olsen

 Real-time Rendering & Graphics Hardware  
 Pradeep Sen Class 21 – April 11, 2007

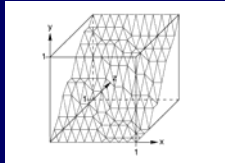

### Basic idea

- Terrain represented by a height field in a uniform grid
- Generate base terrain by simulating pink noise
- Erode terrain
- Render and shade

 Real-time Rendering & Graphics Hardware  
 Pradeep Sen Class 21 – April 11, 2007

### Height fields

- Define height  $z$  on a uniform grid

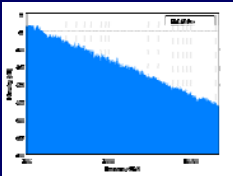

source: povray

 Real-time Rendering & Graphics Hardware  
 Pradeep Sen Class 21 – April 11, 2007

### Pink noise

- Also known as  $1/f$  noise
- Power spectral density is inversely proportional to the frequency

source: wikipedia

 Real-time Rendering & Graphics Hardware  
 Pradeep Sen Class 21 – April 11, 2007

### Simulating pink noise

- Two methods for simulating pink noise:
  - Spectral synthesis
  - Midpoint displacement

 Real-time Rendering & Graphics Hardware  
 Pradeep Sen Class 21 – April 11, 2007

### Spectral synthesis

- Add several octaves of noise together.
- With every octave, the noise frequency is doubled and the amplitude halved
- To create octaves, fill in evenly-spaced random numbers corresponding to the octave's frequency and then calculate the remaining value through interpolation

 Real-time Rendering & Graphics Hardware  
 Pradeep Sen Class 21 – April 11, 2007

### Midpoint displacement

1. Assign random values to the heights on a coarse grid
2. Use interpolation to compute intermediate values
3. Offset these intermediate values by a random amount stipulated by the resolution level
4. Go to 2, repeat until desired resolution is achieved

AGL Real-time Rendering & Graphics Hardware Pradeep Sen Class 21 - April 11, 2007

### Midpoint displacement

AGL Real-time Rendering & Graphics Hardware Pradeep Sen Class 21 - April 11, 2007

### Problems with noise terrain

- Statistical properties a little too homogeneous
- Use Voronoi diagrams to create interesting structure

AGL Real-time Rendering & Graphics Hardware Pradeep Sen Class 21 - April 11, 2007

### Voronoi diagrams

- Randomly place "feature points" in the terrain
- Compute height according to the distance to the n closest feature points:
 
$$h = c_1d_1 + c_2d_2 + c_3d_3 + \dots + c_nd_n$$
- Typically,  $c_1 = -1$ ,  $c_2 = 1$ , rest are 0

AGL Real-time Rendering & Graphics Hardware Pradeep Sen Class 21 - April 11, 2007

### Voronoi cells

- Height computed from voronoi cells

AGL Real-time Rendering & Graphics Hardware Pradeep Sen Class 21 - April 11, 2007

### Add the noise back in...

- Adding perturbation

Image courtesy Jacob Olsen  
AGL Real-time Rendering & Graphics Hardware Pradeep Sen Class 21 - April 11, 2007

### Initial results

- Resulting terrain

Image courtesy Jacob Olsen  
Looks more like the surface of Mars than Earth!  
Why?  
AGL Real-time Rendering & Graphics Hardware Pradeep Sen Class 21 - April 11, 2007

### Initial results

- No erosion!

Image courtesy Jacob Olsen  
AGL Real-time Rendering & Graphics Hardware Pradeep Sen Class 21 - April 11, 2007

### Erosion algorithms

- First described by Ken Musgrave et al. 1989
- Simulate the way that soil is modified by natural phenomenon
- Two kinds:
  - Thermal erosion
  - Hydraulic erosion

AGL Real-time Rendering & Graphics Hardware Pradeep Sen Class 21 - April 11, 2007

## Thermal erosion

- Simulates material breaking off and sliding down slopes
- Loose soil collects at the bottom
- Simulated through a series of iterations that looks at the slope of the surface to decide how much material will be displaced

## Hydraulic Erosion

- Simulates erosion due to water moving through the terrain and displacing material
- Done through a series of steps:
  1. Water appears
  2. Water collects material from terrain
  3. Water flows to another part of the terrain
  4. Water evaporates and deposits sediment

## Nice results!

## Microsoft's efforts in procedural graphics

- Microsoft has been promoting procedural graphics for both DirectX and Xbox360

## DirectX 10.0

- Geometry shaders add vertices on the fly
- Vertex programs had equal number of vertices going in and going out
- Geometry shaders have the capability of creating vertices where none existed!

## X-box 360 Architecture

- Original Xbox had a Pentium III class processor
- Xbox360 features a Xenon processor (not Intel Xeon!)
- 3 PowerPC cores @ 3.2GHz

Xenon processor

Xenon processor architecture

source: ars technica

## PowerPC Cores

- Dual issue, in-order execution for two threads
- Vector Execution Unit VMX128
- Specialized load/unload instructions to pack/unpack data in DirectX vertex format

## Xenon caches

- L1 (32KB) 2-way set associative
- L2 (1MB) 8-way set associative (shared)

## Procedural geometry on the Xbox 360

- The Xenon CPU acts like a “decompressor” and generates the procedural geometry based on a small amount of input from memory

## Programming approach

- One thread handles high-level graphics functions
- Another thread generates content

## Procedural environments

Microsoft, 2006
